How to start the web app

What you will need:

1. A computer with Python installed
2. The VitalWave repository downloaded
3. Access to the same Firebase project used by the iOS app
4. Firebase Authentication and Cloud Firestore already configured

Step 1. Register the web app

appFirebase → Project Overview → **Add app** → **Web (</>)**. Enter a nickname and register.

Step 2. Add the web configuration

- Go to **Settings** → **Project settings** → **General**.
- Scroll down to **Your apps**.
- Select your **web app** (the **</>** icon).
- Under **SDK setup and configuration**, select **Config**.
- You will see something like:

```
const firebaseConfig = {
  apiKey: "...",
  authDomain: "your-project.firebaseapp.com",
  projectId: "your-project",
  storageBucket: "...",
  messagingSenderId: "...",
  appId: "..."
};
```

Copy the `firebaseConfig` object into `web_dashboard/templates/auth.html` of your repo, replacing the existing configuration.

Step 3. Download Server Credentials

Firebase → **Project settings** → **Service accounts** → **Generate new private key**. Rename the downloaded file firebase-admin.json.

Step 4. Store the Credentials

Create a folder called VitalWaveSecrets inside your Mac's **Documents** folder. Place firebase-admin.json there—the current code expects that location. **Keep it out of GitHub and screenshots.**

Step 5. Install dependencies

- Open your Terminal and navigate to the repository’s web_dashboard folder and run the commands below:

```
python3 -m venv .venv

source .venv/bin/activate

python -m pip install -r requirements.txt
```

Step 6. Launch and sign in

- Run “python main.py” in the terminal to launch the web-app
- Press control+C if you would like to stop the server
- Sign in with the same account created in the iOS app
-
